## Description

This 8 A High Temperature Alternistor TRIAC solid state switch series is designed for AC switching and phase control applications such as motor speed and temperature modulation controls, lighting controls, and static switching relays.

**Sensitive** type components guarantee gate control in Quadrants I & IV as needed for digital control circuitry.

**Alternistor** type components only operate in Quadrants I, II, & III and are used in circuits requiring high dv/dt capability.

Standard type devices normally operate in Quadrants I & III triggered from AC line.

## Features & Benefits

- 150°C maximum junction temperature
- Voltage capability up to 800 V
- Surge capability up to 100 A at 60 Hz
- Solid-state switching eliminates arcing or contact bounce that create voltage transients
- No contacts to wear out from reaction of switching events
- Restricted (or limited) RFI generation, depending on activation point of sine wave
- Requires only a short gate activation pulse in each half-cycle
- Recognized to UL 1557 as an Electrically Isolated Semiconductor Device
- Halogen-free and RoHS compliant

## Applications

Excellent for AC switching and phase control applications such as heating, lighting, and motor speed controls.

Typical applications are AC solid-state switches, light dimmers, power tools, home/brown goods and white goods appliances.

Alternistor TRIACs (no snubber required) are used in applications with high inductive loads requiring the highest commutation performance.

## Design Considerations

Careful selection of the correct component for the application's operating parameters and environment will go a long way toward extending the operating life of the Thyristor. Good design practice should limit the maximum continuous current through the main terminals to 75% of the component rating. Other ways to ensure long life for a power discrete semiconductor are proper heat sinking and selection of voltage ratings for worst case conditions. Overheating, overvoltage (including dv/dt), and surge currents are the main killers of semiconductors. Correct mounting, soldering, and forming of the leads also help protect against component damage.
