5 V, 2 A Ultra Low Consumption Load Switch With Slew Rate Control

## Pinout Designation

## Pin Description

Pin #	Pin Name	Description
A1	V <sub>OUT</sub>	Switch output
A2	V <sub>IN</sub>	Switch input. Supply voltage for IC
B1	GND	Ground
B2	EN	Enable to control the switch. The EN pin has an internal pull-down resistor

## Description

The LQ05021QCS4 is an ultimated efficient, 2 A rated integrated load switch with slew rate control. Its outstanding performance in efficiency makes this an ideal solution for applications like IoT, mobile and wearable.

This remarkable device incorporates cutting-edge technology that achieves industry-leading performance in terms of the lowest quiescent current ( $I_Q$ ), and shutdown current ( $I_{SD}$ ). The low  $I_Q$  and  $I_{SD}$  solutions empower designers to curtail parasitic leakage current, enhance system efficiency, and extend battery lifespan.

The integration of slew rate control within the LQ05021QCS4 serves as a critical enhancement to system reliability, effectively mitigating voltage swings on the bus during switching events. In situations where uncontrolled switches might otherwise generate substantial inrush currents, leading to voltage droop and potential bus reset events, the slew rate control functions to confine inrush current during activation, thereby minimizing the voltage droop.

The LQ05021QCS4 load switch device is designed in a chip scale package of 0.77 mm x 0.77 mm x 0.46 mm with 4 bumps and 0.4 mm pitch and support an extensive input voltage range, enhancing both the operational lifespan and the resilience of the system. Additionally, this single device can serve in various voltage rail applications, streamlining inventory management and lowering operational expenses.

## Features and Benefits

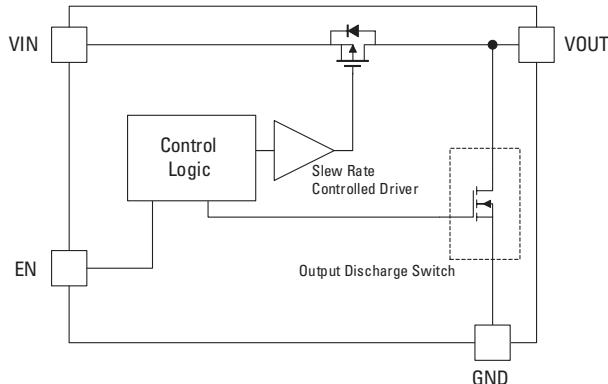

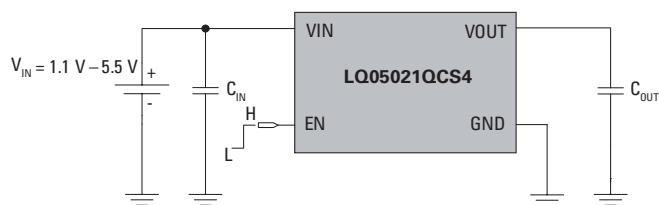

- Ultra-low  $I_Q$ : 1 nA Typ @ 5.5 V<sub>IN</sub>
- Ultra-low  $I_{SD}$ : 19 nA Typ @ 5.5 V<sub>IN</sub>
- Low  $R_{ON}$  = 34 mΩ Typ @ 5.5 V<sub>IN</sub>
- $I_{OUT}$  max = 2.0 A
- Wide input range: 1.1 V to 5.5 V, 6 Vabs max
- Controlled rise time: 430 µs at 3.3 V<sub>IN</sub>
- Internal EN pull-down resistor
- Integrated output discharge switch
- Ultra small: 4 bumps in a 0.77 mm x 0.77 mm x 0.46 mm WLCSP

## Applications

- Mobile devices
- Data storage, SSD
- IoT devices
- Wearables
- Low power subsystems

## Application Information

The LQ05021QCS4 is a highly efficient integrated load switch with a 2 A capacity. It allows a fixed slew rate control to limit inrush current when activated. This device works with a wide input voltage range, from 1.1 V to 5.5 V, and has minimal on-resistance to reduce power loss. When it is off, it has very low leakage current, saving power resources. It is in a chip scale size package at 0.77 mm x 0.77 mm x 0.46 mm with 4 bumps at a 0.4 mm pitch make it ideal for efficient manufacturing in the space-saving required applications.

### Input Capacitor

The proper functioning of the LQ05021QCS4 needs the presence of an input capacitor. Consider using a 1  $\mu\text{F}$  capacitor positioned near the VIN pin to address voltage fluctuations on the input power rail that may occur as a result of transient inrush current during startup. To reduce the extent of the input voltage drop, suggest to use a higher input capacitor value.

### Output Capacitor

It is advisable to employ an output capacitor to minimize voltage undershoot on the output pin during switch-off.

Voltage undershoot may arise due to parasitic inductance from board traces or deliberate load inductances. In the presence of load inductances, utilizing an output capacitor can enhance output voltage stability and overall system reliability. Position the  $C_{OUT}$  capacitor in close proximity to the  $V_{OUT}$  and GND pins.

### EN pin

The device can be turned on by setting the EN pin to a high level. Be aware that there is an internal pull-down resistor in EN pin which can pull the primary switch to "off state" as long as no EN signal from an external controller is applied.

### Output Discharge Function

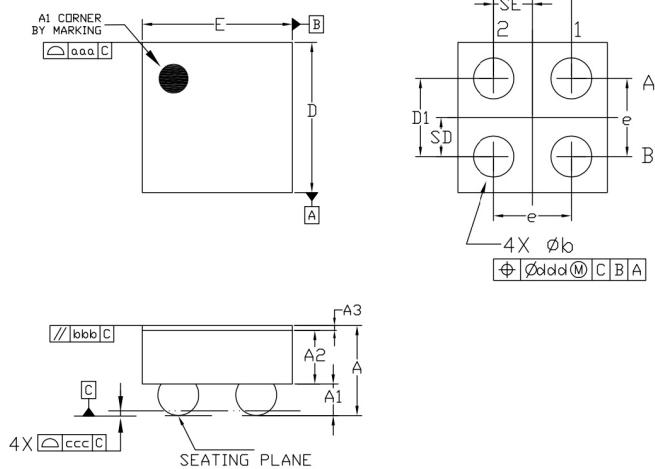

The device incorporates an internal discharge N-channel FET switch located at the VOUT pin. When the EN signal switches the primary power FET to an off state, the N-channel switch activates to rapidly discharge the output capacitor.

### Board Layout

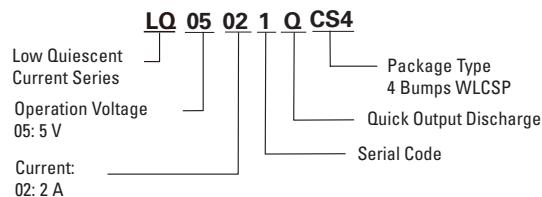

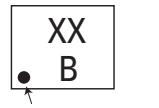

To minimize the impact of parasitic inductance, it is advisable to keep all traces as short as possible. Using wider traces for  $V_{IN}$ ,  $V_{OUT}$  and GND is recommended to mitigate parasitic effects during dynamic operations and enhance thermal efficiency under high load currents.
