## 5.5V 4A Low-Ron Power Distribution Load Switch

### Web Resources

Download ECAD models, order samples, and find technical resources at [www.littelfuse.com](http://www.littelfuse.com)

### Pinout Designation

### Pin Description

Pin Name	Pin #	Description
GND	1	Ground pin.
EN	2	Enable pin. EN has accurate 1.20V ON threshold. Pull EN pin above ON threshold enables the LS0504E. Pull EN pin below 0.4V disables the LS0504EDD12.
IN	3	Input pin. Connect a 10 $\mu$ F or greater ceramic capacitor from IN to GND close to the IC
OUT	4	Output pin. Connect a 10 $\mu$ F or greater ceramic capacitor from OUT to GND close to the IC

### Functional Block Diagram

### Description

The LS0504EDD12 is a compact, low  $R_{ON}$  load switch with controlled slew rate. The device operates over an input voltage range of 1.8V to 5.5V and can support maximum continuous current of 4A.

The controlled output slew rate greatly reduces inrush current at start-up when charging large bulk load capacitances, thereby minimizing input supply voltage droop. LS0504E comes with built-in full protections against over current, over voltage and over temperature. It provides an accurate enable threshold which allows users to program input under-voltage lockout (UVLO) threshold through external resistor divider network. It has built-in 8 $\Omega$  resistor for quick output discharge at disable.

### Features & Benefits

- Wide Input Range from 1.8V to 5.5V
- Low  $R_{ON}$  at 26m $\Omega$
- Up to 4A continuous current
- Built-in Over-Voltage, Over-Current and Over Temperature Fault Protections
- 250 $\mu$ s internal Soft-start for 5V output
- Accurate 1.2V Enable Threshold
- Quick Output Discharge in Shutdown

### Applications

- Solid-state Drives
- Wearable IOT Devices
- Portable Medical Equipment
- Portable Media Players
- Smartphones and Tablets

### Typical Applications

**Note:** \*USB Port Connection

When the input of LS0504E is connected to a USB port, recommend to add either a 6V Rating TVS diode or a 220 $\mu$ F Aluminum Cap to absorb input surge current during USB cable hot plug-in.

# LS0504EDD12

## 5.5V 4A Low-Ron Power Distribution Load Switch

### Absolute Maximum Rating (Reference to GND)

Symbol	Value	Units
All Pins	-0.3 to +6.5	V
ESD	Class 2	
Junction Temperature Range	-40 to +150	°C
Storage Temperature Range	-65 to +150	°C
Lead Temperature (Soldering 10s)	260	°C

**Notes:** Stress exceeding those listed "Absolute Maximum Ratings" may damage the device.

### Recommend Operating Conditions

Symbol	Value	Units
Input Voltage ( $V_{IN}$ )	+1.8 to 5.5	V
Junction Temperature Range	<135	°C

**Note:** The device is not guaranteed to function outside of the recommended operating conditions.

### Thermal information

Symbol	Value	Units
Maximum Power Dissipation ( $T_A=25^\circ\text{C}$ )	0.5	W
Thermal Resistance ( $\theta_{JA}$ )	200	°C/W
Thermal Resistance ( $\theta_{JC}$ )	70	°C/W

**Notes:**

1. Measured on JESD51-7, 4-Layer PCB.

2. The maximum allowable power dissipation is a function of the maximum junction temperature  $T_{J,MAX}$ , the junction to ambient thermal resistance  $\theta_{JA}$ , and the ambient temperature  $T_A$ . The maximum allowable continuous power dissipation at any ambient temperature is calculated by  $P_{D,MAX} = (T_{J,MAX} - T_A) / \theta_{JA}$ . Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.

### Electrical Characteristics ( $T_A = +25^\circ\text{C}$ , $V_{IN}=5\text{V}$ , $V_{EN}=2\text{V}$ , unless otherwise specified)

Parameter	Test Conditions	Min	TYP	Max	Unit
Input-Supply Voltage Range		1.8		5.5	V
Shutdown Current	$V_{EN}=0\text{V}$		0.01	1	$\mu\text{A}$
Quiescent Supply Current	$V_{EN}=2\text{V}$ , $I_{LOAD}=0\text{mA}$		35	50	$\mu\text{A}$
Input Under-Voltage Lockout Threshold Rising	$V_{IN}$ ramp up		1.65		V
Input Under-Voltage Lockout Threshold Hysteresis	$V_{IN}$ ramp down		0.15		V
Input Over-voltage Protection Rising Threshold	$V_{IN}$ ramp up		6.3		V
Input Over-voltage Protection Hysteresis	$V_{IN}$ ramp down		0.3		V
EN ON Threshold	EN Rising	1.14	1.20	1.26	V
EN ON Threshold Hysteresis	EN Falling		0.1		V
EN OFF Threshold	Shutdown current < $1\mu\text{A}$			0.4	V
Load Switch FET On Resistance $R_{ON}$			26		$\text{m}\Omega$
Load Switch Current Limit			4.5		A
Output Discharge Resistance	$V_{IN}=5\text{V}$ , $V_{EN}=0\text{V}$ , $V_{OUT}=0.3\text{V}$		8		$\Omega$
Load Switch soft-start time	$V_{IN}=5\text{V}$ , $I_{load}=500\text{mA}$		250		$\mu\text{s}$
Thermal Shutdown			140		°C
Thermal Shutdown Hysteresis			45		°C

## 5.5V 4A Low-Ron Power Distribution Load Switch

### Theory of Operation

The LS0504EDD12 is 5.5V low  $R_{ON}$  current limited load switches in 4-pin DFN1.2mmx 1.6mm package. To minimize voltage drop for low voltage and high current rails, the device integrates an ultra-low  $R_{ON}$  N-channel MOSFET switch with 26m $\Omega$ . At enable, the LS0504E has internal soft-start which reduces inrush current and minimizes input power supply droop. When disabled, the device automatically discharges output voltage through an internal 8  $\Omega$  resistor. The LS0504EDD12 comes with built-in over current, over voltage and over temperature fault protection. When over current condition is detected, the LS0504EDD12 enters hiccup mode to minimize power dissipations. In hiccup mode, the power MOSFET is turned off to disconnect the load from input supply for a pre-determined period of time before it automatically re-tries to start up again with soft-start. If the over load condition persists with high ambient temperature, LS0504EDD12 junction temperature could rise above +140 °C, which is the built-in over temperature protection threshold. In this case, the LS0504EDD12 will turn off the power switch and wait for the junction temperature to drop below +95°C before it tries to automatically re-start.

### Application Information

The LS0504EDD12 is a load switch that integrates an internal low Ron N-channel MOSFET to reduce power loss. It operates with wide input voltage range and provides comprehensive protections.

### Input and Output Capacitor Selection

For stable operation, recommend to place a 10 $\mu$ F or higher ceramic type X5R or X7R bypass capacitor at the IN and OUT pins. When the input is connected to a USB port, either USB cable hot plug-in or output short circuit can cause large ringing on the input. The device internal circuitry could be damaged if the input ringing voltage exceeds the absolute maximum rating of 6V. For these applications, it's recommend to add a 220 $\mu$ F or greater Aluminum bypass capacitor or 6V rating Transient Voltage Suppressor (TVS) at the input to absorb large input surge current.

### Enable

When input voltage is above the internal input under-voltage lockout threshold (typ.1.65V), the LS0504EDD12 can be enabled by pulling the EN pin to above 1.2V. The device is disabled if the EN pin is pulled below 1.1V. The enable/disable threshold for EN pin is accurately designed to be 1.2V and 1.1V respectively, so one can also use external resistor divider to program the external input under-voltage lockout level (above 1.65V). Pull EN pin below 0.4V to turn off all circuitry and get <1 $\mu$ A shutdown current.

### Soft-Start

The LS0504EDD12 has built-in 250 $\mu$ s soft start at enable. During the soft start period, VOUT will ramp up with a controlled slew rate to minimize input inrush current.

### Thermal Considerations

For best performance, all traces should be as short as possible. To be most effective, the input and output capacitors should be placed close to the device to minimize the effects that parasitic trace inductances may have on normal and short-circuit operation. Using wide traces for  $V_{IN}$ ,  $V_{OUT}$ , and GND helps minimize the parasitic electrical effects along with minimizing the case to ambient thermal impedance. To ensure reliable operation, assume worst case junction temperature should not exceed +135°C. This restriction limits the power dissipation the regulator can handle in any given application. To ensure the junction temperature is within acceptable limits, calculate the maximum allowable dissipation,  $P_{D(max)}$ , and the actual dissipation,  $P_D$  which must be less than or equal to  $P_{D(max)}$ .

The maximum-power-dissipation limit is determined using the following equation:

$$P_{D(MAX)} = \frac{T_{JMAX} - T_A}{R_{\theta JA}} = \frac{135^{\circ}\text{C} - 25^{\circ}\text{C}}{200^{\circ}\text{C}} = 0.55\text{W}$$

Where:

$T_{Jmax}$  is the maximum allowable junction temperature.

$R_{\theta JA}$  is the thermal resistance junction-to-ambient for the package (see the Dissipation Ratings table).

$T_A$  is the ambient temperature.

### PCB Layout Recommendation

1. IN and OUT traces should be as short and wide as possible to accommodate for high current.
2. The IN pin should be bypassed to ground with low ESR ceramic bypass capacitors. The typical recommended bypass capacitance is 10 $\mu$ F ceramic with X5R or X7R dielectric. This capacitor should be placed as close to the device pins as possible.
3. The OUT pin should be bypassed to ground with low ESR ceramic bypass capacitors. The typical recommended bypass capacitance is one-tenth of the VIN bypass capacitor of X5R or X7R dielectric rating. This capacitor should be placed as close to the device pins as possible.
